

## If you use Radan then this document could save you lots of money!

### Reduce your programming time with your own In-house developed Macros....

#### What are macros?

Macros are all about maximising efficiency and reducing human error, but you need some computer programming knowledge in order to write them. Usually companies pay outside contractors to write them, but this can be an expensive service.

Well that has now changed. You can write and maintain your own macros in-house without any computer programming knowledge with the MaCGen application from Parametric Solutions.

### MaCGen for Radan

#### Quick and Easy Radan Macro Creation

Parametric Solutions have been writing macros for its customers for years. We developed an in-house tool so to rapidly produce macros and take the computer programming element out of the process .

We found it such a useful tool that we have now decided to release this application out to our customers, giving them the power to easily create and maintain their own macros.

MaCGen is a database application where you store all your macro logic and publish macros from a click of a button. It's so easy to use that most users are self sufficient after just half a days training.

Once you have your library of macros up and running you will be able to reduce your CAD/CAM desktop time whilst increasing quality.

You could get MacGen in your company for as little as £500. For more information and a video visit our information page at:
